Project Number: 19-009  
Subject: 301 Mission Retrofit Supplemental Monitoring Report 061S: Results as of July 5, 2022

CONTEXT

This supplemental memorandum summarizes results from the monitoring plan implemented at the 301 Mission property following the process established in a letter from Simpson, Gumpertz and Heger (SGH) to the San Francisco Department of Building Inspection (SFDBI) dated March 23, 2022. Instrumentation to temporarily monitor the structure during the excavation and shoring project phases was installed on April 20, 2022, including survey prisms installed at approximately one floor level above grade on the exterior of the building. This supplemental memorandum is for review only. It only contains ongoing monitoring information. This supplemental memorandum does not contain recommendations based upon the ongoing monitoring information.

PRESENTATION OF DATA

Figure S-01 presents the locations of the survey prisms (including both control and target prisms) as referenced in later figures.

Figure S-02 presents the differential horizontal movement toward the excavation at survey prisms installed at approximately one floor level above grade on the exterior of the building, as well as the average in each of the project north-south and east-west direction, since April 26, 2022, through July 5, 2022. Limits established in the aforementioned letter are included for reference.

Figure S-03 presents differential lateral roof deflection data due to shoring wall installation and excavation since April 26, 2022, through July 5, 2022. Limits established in the aforementioned letter are included for reference. Note that differential lateral roof deflection due to shoring wall installation and excavation is calculated following the aforementioned letter as:

$$\Delta_R = \Delta_{R-prism} - \Delta_H - \alpha T$$

where:  
$\Delta_R$ is the computed differential lateral roof deflection due to shoring wall installation and excavation;  
$\Delta_{R-prism}$ is the differential lateral roof deflection obtained from prism data;  
$\Delta_H$ is the average differential horizontal movement “at-grade”;  
$\alpha$ is the weekly lateral roof deflection rate (computed as described below); and,  
$T$ is the number of weeks since initiation of shoring wall installation or excavation.

The time frame over which $\alpha$ is computed changes depending on the phase of the work, as specified in the aforementioned letter. For the construction phase during which the shoring wall is installed (currently
ongoing), \( \alpha \) is computed from the two months of monitoring conducted immediately prior to the shoring wall installation (i.e., monitoring data from February 22, 2022, through April 25, 2022). During the excavation phase (to occur in the future), \( \alpha \) will be readjusted to reflect the recorded lateral roof deflection rate in the two months immediately preceding the start of excavation (dates to be determined).

Figure S-04 presents rates of differential lateral roof deflection data due to shoring wall installation and excavation since April 26, 2022, through July 5, 2022. Limits established in the aforementioned letter are included for reference. Note that the rates are calculated as:

\[
\frac{d\Delta R}{dT} \approx \frac{\Delta R_{t} - \Delta R_{t-1}}{T_{t} - T_{t-1}}
\]

where: \( t \) is an index representing the current instance in time; and \( t - 1 \) is an index representing the previous instance in time.

CLOSING

Please contact us if you have any comments or questions, or if you would like to discuss the results presented in this memorandum.
